Air Sampling Report
Tuesday, September 25, 2001

Investigators from the National Institute for Occupational Safety and Health (NIOSH) collected air samples on personnel actively involved in rescue efforts on or in the vicinity of the debris pile to characterize occupational exposures. Below are the sampling results for Tuesday, September 25, 2001.

Air Samples

Carbon Monoxide

- 2 real-time personal breathing zone samples were collected for carbon monoxide
  - Both time-weighted average concentrations were below 7 ppm
  - A maximum peak of 84 ppm was observed on a firefighter using a cutting torch
