Asbestos Air Monitoring Data

This table shows how much asbestos EPA measured in the ai
shown. Daily summaries of this data and how it compares to
health are also available.

EPA can measure asbestos in several ways. For these data tal
measurements in terms of the number of asbestos structures f
our air monitors (structures can include single, overlapping, a
level of concern for asbestos is based on continuous exposur
square millimeter for an extended period. **Because cleanup e
dramatically over the next several weeks, EPA does not e
amount of asbestos to have increased risks of health prob**

Description of the Benchmarks, Standards, and Guidlines used to Evaluate Environmental Conditions.

*The information contained in this database should be considered provisional and may be subject to adjustment upon final analysis.

These results are different from the concentrations previously reported on this website. The previous results included an additional, unnecessary adjustment for the volume of air sampled. The corrected values listed now are the result of the same methods used for more recent data. The corrected asbestos concentrations are generally lower than the previously reported values, but use the correct method for calculating the effect of the volume of air sampled.

DUP - indicates that more than one sample was taken at a particular time; all values are reported.

There may be gaps in daily readings because of relocated construction equipment and variations in sampling locations.

For more information about asbestos exposure and human health, see the Asbestos Fact Sheet.
