SUBJECT:
Re: Indoor Air results

My count of the data is 10 residential units had detectable levels of asbestos in the dust (note: this count does not include the one residential unit that had dectable levels in the dust collected from a window sill).

The totals for dectable levels of asbestos in the dust are:

10 Residential units with one TEM result above 1% (1.5%) [note: window sill was <1%)

5 common areas with one TEM above 1% (1.5%)

5 outdoor areas with 2 PLM's and 2 TEM's above 1%

Sven, can you clear up the question re: the ATSDR website below?

>>> Roger Hayes 04/03/02 12:58PM >>>
ATSDR has a revised summary on their web page. We'd like to have the hotline operators refer people to this or FAX them a copy but I'm not sure this info is the same as what we had before.
Under the section summarizing Dust Samples Results they state that settled dust was found in 10 of the residential units, 5 of the common areas, and 5 of the outdoor areas. "Only 2 of the 14 indoor samples exceeded the 1% level"
a. Did they mean 2 of the 15 (10+5)? b. are they saying that there were only 2 samples exceeding 1% and both were inside? what about the 2 samples outside that exceeded 1% and required the clean-up by the landlord?
Is it possible to put the Department's power point presentation on the web page?
