**U.S. CONGRESSMAN JERROLD NADLER  
WHITE PAPER  
LOWER MANHATTAN AIR QUALITY  
Last Updated, March 11, 2002**

**Executive Summary**

- When Environmental Protection Agency (EPA) Administrator Christine Todd Whitman announced to New Yorkers, shortly after the September 11<sup>th</sup> terrorist attacks, that their “. . . air is safe to breathe,” she misled the public because the EPA did not have the proper information to make such an assurance.
- The EPA also misled the public about air quality by mischaracterizing its own data and ignoring or withholding other critical data that contradicted Ms. Whitman’s assurances.
- The EPA allowed the City of New York to handle indoor air quality. The City, in turn, delegated indoor air matters (testing and remediation) to individual building owners for indoor public spaces, and to tenants for indoor private spaces. The City provided little enforcement with respect to indoor public spaces and no enforcement with respect to indoor private spaces, and gave improper advice regarding hazardous materials testing and remediation.
- As a result of the EPA’s misleading statements about air quality and because it allowed the City of New York to handle matters related to indoor environments, there has been inadequate hazardous materials testing and remediation inside residential and commercial buildings downtown – putting the public health at risk.
- By allowing indoor air quality in residential and commercial buildings to be handled by the City of New York, and by not properly exercising its oversight authority pursuant to the National Contingency Plan (NCP), the EPA violated federal law.
- The EPA’s inaction in New York City downtown residences and commercial buildings stands in stark contrast to its response in its own building at 290 Broadway, as well as at other non-Superfund hazardous materials contamination sites around the country.
- The Citizens of Lower Manhattan -- residents, workers and building owners -- have been victims of a terrorist attack on this nation, and should not bear the burden of making their homes, offices, and businesses safe again. The EPA must act in accordance with the NCP, and take action immediately to systematically and properly test and remediate all downtown buildings affected by the World Trade Center tragedy, using properly trained personnel and the best-available equipment and methods tied to genuine, established health-based standards. Six months after the attacks, it is now clear that the EPA is the only governmental entity with the authority, resources, expertise and mandate to do this job. This is the only course of action if the EPA is to restore the public trust and protect the public health.

### **Christine Todd Whitman's "Safe" Assurance**

When EPA Administrator Christine Todd Whitman announced to New Yorkers, shortly after the September 11<sup>th</sup> terrorist attacks, that their "...air is safe to breathe," she misled the public because the EPA did not have the proper information to make such an assurance. Ms. Whitman's statement was first made in written form on September 18, 2001<sup>1</sup> (though she had been quoted as early as September 14, 2001<sup>2</sup>), before there was a single test of indoor air quality conducted by any governmental entity.

In response to criticism on this point, the EPA countered that Ms. Whitman's statement was made on the basis of outdoor air tests only. [It should be noted that the EPA had not even intended to do testing of outdoor air in residential areas until the Ground Zero Elected Officials Task Force (GZTF) requested that it do so in a memo dated September 21, 2001, in which it also requested indoor air testing.<sup>3</sup>] On January 13, 2002, an EPA Region II spokesperson stated, "That's [indoor air testing] not our job and we have no policies or procedures for doing that type of testing."<sup>4</sup> On January 17, EPA Region II issued a statement saying, "...EPA has lead [sic] the effort to monitor the outdoor environment while the city of New York has taken the lead regarding the reoccupancy of buildings."<sup>5</sup> Nevertheless, indoor air quality data did not even exist at the time of Ms. Whitman's September 18 statement.

To this day there have only been two small rounds of governmentally conducted or commissioned tests of indoor air quality in Lower Manhattan post 9/11 – and neither can be used as evidence to support the statement that indoor air is "safe." The first study, commissioned by the Ground Zero Elected Officials Task Force (GZTF) on September 18, 2001 found elevated levels of hazardous materials in a number of apartments that had not been cleaned or professionally remediated, and some that had been cleaned or professionally remediated.<sup>6</sup> The second study, conducted by the Agency for Toxic Substances and Disease Registry (ATSDR), at the request of New York City Department of Health (NYC DOH) in November and December 2001, is still not completed. According to a NYC DOH press release and a web site to which the release refers, the

<sup>1</sup> EPA Press Release, "Whitman Details Ongoing Agency Efforts to Monitor Disaster Sites, Contribute to Cleanup Effort," September 18<sup>th</sup>, 2001. Ms Whitman's full statement is as follows: "We are very encouraged that the results for our monitoring air quality and drinking water conditions in both New York and near the Pentagon show that the public in these areas is not being exposed to excessive levels of asbestos or other harmful substances. Given the scope of the tragedy from last week, I am glad to reassure the people of New York and Washington, DC, that their air is safe to breath[sic] and their water is safe to drink." This sentiment has been echoed repeatedly by EPA spokespeople and other governmental agencies, and, to this day, has been used as the definitive government comment on Lower Manhattan air quality post-9/11. Two days later, Ms. Whitman added in a press release, "New Yorkers... need not be concerned about environmental issues as they return to their homes and workplaces." (September 21, 2001).

<sup>4</sup> Schneider, Andrew, "NY Officials Underestimate Danger," *St. Louis Post Dispatch*, January 13, 2002.

<sup>5</sup> EPA Region II Press Release, "EPA Statement," January 17, 2002.

<sup>6</sup> Chatfield, Eric J. (Ph.D) and Kominshy, John R. (M.Sc., CIH, CSP, CHMM), "Summary Report: Characterization of Particulate Found in Apartments After Destruction of the World Trade Center," requested by the 'Ground Zero' Elected Officials Task Force, October 12, 2001.

agency did find elevated levels of hazardous materials in early results, but the full results of the tests will not be available until April, 2002.<sup>7</sup>

However, even with respect to outdoor air, Ms. Whitman's statement has been countered directly by a published report by University of California at Davis scientist, Thomas Cahill.<sup>8</sup> Dr. Cahill's team, working in conjunction with the U.S. Department of Energy, found that the amount of pulverized "ultra-fine particulate matter" emitted from the World Trade Center (WTC) destruction, was "unprecedented" and according to the *Los Angeles Times*, "...outdid even the worst pollution from the Kuwait oil fields fires."<sup>9</sup> According to Cahill, the EPA did not test for this level of very fine particulate matter (.25 to .09 microns), only for larger particles with less sensitive equipment. "The EPA could have identified these particles within a couple of days if they looked for them, but they didn't."<sup>10</sup> Dr. Cahill also noted in the article that EPA scientists themselves have acknowledged that the ultra-fine particles are the "most hazardous" because they can evade the body's protection and lodge deep inside the lungs.<sup>11</sup> An extended commentary by Dr. Cahill on these topics was made at the February 23, 2002 EPA National Ombudsman Hearing in New York City.<sup>12</sup>

Of course it stands to reason that if there were problems related to outdoor air, problems related to indoor air would necessarily arise. An EPA Region II Spokesperson acknowledged that very point when she said recently, "We [the EPA] have from the start been clear that what we found on the outside was likely to have gotten inside people's apartments."<sup>13</sup>

### **The EPA Misleads Further**

The EPA also misled the public about air quality by mischaracterizing its own data and ignoring or withholding other critical data that contradicted Ms. Whitman's assurances. Ms. Whitman's statement, which has been echoed repeatedly by agency officials at every level of government to this day, was made even as EPA officials possessed evidence that contradicted her statement.

<sup>7</sup> NYC DOH Press Release, "NYC Department of Health Presents Findings from Indoor Air Sampling in Lower Manhattan," February 8, 2002.

<sup>10</sup> Ibid.

<sup>11</sup> Ibid.

<sup>12</sup> "Official Transcript," EPA National Ombudsman First Investigative Hearing on World Trade Center Hazardous Waste Contamination," February 23, 2002, testimony of Dr. Thomas Cahill, Professor, University of California at Davis, p. 15-72.

<sup>13</sup> Jones, Charisse, "Anxieties Over Toxins Rise at Ground Zero," *USA Today*, February 7, 2002.

Ms. Whitman's statement mischaracterizes EPA's own data. For example, in a January 25, 2002 speech given by Walter Mugdan, EPA Region II Counsel, he states, ". . . a significant number of the WTC bulk dust samples that we analyzed did have more than 1% asbestos."<sup>14</sup> Further, in a document detailing information provided by EPA Region II in response to a Freedom of Information Act (FOIA) request, the New York Environmental Law and Justice Project cites numerous examples of data points that exceeded EPA "levels of concern."<sup>15</sup> Joel Kupferman, Executive Director of the New York Environmental Law and Justice Project, has stated repeatedly that these details contradict Ms. Whitman's safety assurances, as have other experts.<sup>16</sup> And a 22-year veteran of the EPA's Hazardous Waste Identification Division, Dr. Cate Jenkins, has issued a memo challenging EPA's testing methods and "clearance levels" for hazardous materials, which she argues belie an honest assessment of safety.<sup>17</sup>

Other government officials also provided the EPA with data challenging Ms. Whitman's safety assurances. For example, the above mentioned GZTF report by Chatfield and Kominsky was given to EPA officials by the researchers (who are long-time EPA contractors) on October 12, 2001. To this day, the EPA has neither commented on nor taken any action with respect to the findings of elevated levels of hazardous materials in this report. According to an analysis by Dr. Cate Jenkins, Chatfield and Kominsky found 9 asbestos strands to every one found by the EPA. She went on to argue that those levels of asbestos in Lower Manhattan are comparable or in excess of those found in Libby, Montana, a federal Superfund site.<sup>18</sup>

Beyond downplaying its own findings and ignoring other contradictory findings presented to it, the EPA has withheld important data from the public. Specifically, it took a FOIA request by the New York Environmental Law and Justice Project to get test results showing dangerous levels of hazardous materials in outdoor ambient air. The EPA claimed that its failure to make this information available was an "oversight"<sup>19</sup>

Additionally, the *St. Louis Post Dispatch* reported in February that the United States Geological Survey (USGS), using the country's best detection equipment and methods, found pH levels in World Trade Center dust that are ". . . as corrosive as drain cleaner" and passed this information along to health experts at the EPA on a "government-only" website. In the article, Andrew Schneider (the paper's Pulitzer Prize-

winning environmental journalist) charges “the USGS data was not released by the EPA nor apparently were the environmental agency’s own test results on the dust.” The EPA claims to have released this data to the public, but when Schneider reviewed all of the EPA’s statements made since 9/11, he found nothing that warned of these high pH levels. According to the New York Committee for Occupational Safety and Health (NYCOSH), such dust “once it’s in contact with moist tissue – the throat, the mouth, nasal passages, the eyes and even sweaty skin – it becomes corrosive and can cause severe burns.”<sup>20</sup>

### **The EPA Passes the Buck to the City**

The EPA allowed the City of New York to handle indoor air quality. The City, in turn, placed the burden for indoor air matters (testing and remediation) on individual building owners for indoor public spaces, and on tenants for indoor private spaces. The City provided little enforcement with respect to indoor public spaces, no enforcement with respect to indoor private spaces, and gave improper advice regarding hazardous materials testing and remediation.

As was previously mentioned, it first became clear to the public in mid-January, 2002 that the EPA had allowed the City of New York to handle indoor air quality.<sup>21</sup> An EPA spokesperson stated, on January 11, that “. . . indoor air is beyond EPA’s jurisdiction.”<sup>22</sup> An EPA Region II spokesperson went a step further later in January and stated the EPA had taken no responsibility for indoor air quality and was, in fact, satisfied by the City’s work. That spokesperson stated, “The EPA’s job was to monitor outdoor air. Monitoring indoors—that wasn’t our job. That’s what the city took care of.” According to the article, she added “that she felt the city did a good job of testing and monitoring indoor air.”<sup>23</sup>

However, the City of New York has demonstrated that it also has not done the job properly. At a Senate Subcommittee field hearing on February 11, 2002, New York City Department of Environmental Protection (NYC DEP) Commissioner Joel Miele admitted that, although the City had taken the lead on indoor air, it actually placed the burden for testing and remediating indoor spaces on the landlords and property owners, as it did not really have the capacity to handle the job because it is primarily a “water and sewer agency.”<sup>24</sup> The City has made very little effort to ensure that such testing or remediation

<sup>24</sup> Miele, Joel (Commissioner, NYC DEP) “Testimony before the United States Senate Subcommittee on Clean Air, Wetlands, and Climate Change,” February 11, 2002. Remark made during the question and answer period.

actually took place, other than issuing one “public notice” on the subject.<sup>25</sup> The only record of any enforcement seen to date is a letter sent by DEP to building owners the day after the Senate hearing, requesting documentation of cleanup measures taken.<sup>26</sup> Moreover, that letter informed the landlords and property owners that they are only responsible for common or public areas of buildings.<sup>27</sup> And, according to some experts, the type of testing that DEP instructed building owners and managers to use wouldn’t properly detect the hazardous materials.<sup>28</sup>

Testing and remediating of actual apartments and private workspaces has been left up to individual tenants.<sup>29</sup> There has been no enforcement whatsoever of any rules or regulation with respect to testing or cleaning indoor private spaces.<sup>30</sup>

As the City placed the burden for testing and remediating indoor private spaces on individual tenants, it referred individuals for advice (though no other assistance) to the New York City Department of Health (NYC DOH) for recommendations on re-occupying homes and businesses.<sup>31</sup> The EPA, on its website and in public press releases, also referred residents to these recommendations<sup>32</sup>, which state that “based on the asbestos test results received thus far, there are no significant health risks” and advises people to remove dust using a “wet rag or wet mop.”<sup>33</sup> EPA Region II Acting Deputy Regional Administrator Kathleen Callahan reiterated that downtown tenants should look to the DOH guidelines for cleaning their indoor spaces in testimony before the New York City Council on December 11, 2001.<sup>34</sup>

<sup>32</sup> EPA Region II Press Release, “EPA and OSHA Web Sites Provide Environmental Monitoring Data From World Trade Center And Surrounding Areas: Data Confirms No Significant Public Health Risks; Rescue Crews and Nearby Residents Should Take Appropriate Precautions,” October 3, 2001.

<sup>33</sup> “Recommendations for People Re-Occupying Commercial Buildings and Residents Re-Entering Their Homes,” ([www.ci.nyc.ny.us/html/doh/html/alerts/wtc3.html](http://www.ci.nyc.ny.us/html/doh/html/alerts/wtc3.html)), printed on January 24<sup>th</sup> 2002 3:42pm.

<sup>34</sup> Callahan, Kathleen (Acting Deputy Regional Administrator, EPA Region II), “Testimony before the New York City Council Environmental Protection Committee,” December 11, 2001.

This advice, which details unsafe and illegal cleaning methods,<sup>35</sup> directly contradicts a letter from John Henshaw, Assistant Secretary for OSHA, which states, "in that the materials containing asbestos were used in the construction of the Twin Towers, the settled dust from their collapse must be presumed to contain asbestos" and therefore, OSHA federal regulations apply to the remediation of this material (emphasis added).<sup>36</sup> The DOH advice ironically also contradicts a statement of dubious veracity from an EPA Region II Spokesperson who said in a February 2002 *USA Today* article, "We have from the start been clear. . . they [those in Lower Manhattan] could assume that the material is asbestos-containing and that they needed to get that material cleaned up using professional contractors."<sup>37</sup> If, in fact, the dust is presumed to be "asbestos containing material," its handling and removal is regulated under strict federal guidelines.<sup>38</sup>

Despite these facts, EPA Administrator Christine Todd Whitman defended her agency's actions of directing people to the City DOH's unsafe guidelines. In a February 22, 2002 letter to Congressman Jerrold Nadler (NY-08), Whitman wrote "In regard to your concern that the EPA guided residents to the New York City Health Department for direction on cleanup of homes, this was appropriate since traditionally, the health agencies make recommendations to the public on health-related matters."<sup>39</sup>

As was previously mentioned, the City did request an extremely limited indoor testing program by done by ATSDR. However, details about this program are still not known. In October, November, and December, NYC 30 apartment were tested s for hazardous materials, though the nature of those tests are unclear, and the full results will not be available until the Spring.<sup>40</sup>

**Result of EPA Misdeeds: Inadequate Indoor Hazardous Materials Remediation and a Threat to Public Health**

As a result of the EPA's misleading statements about air quality and because it allowed the City of New York to handle matters related to indoor environments with no oversight, there has been inadequate hazardous materials testing and remediation inside residential and commercial buildings in Lower Manhattan – putting the public health at risk.

A significant number of downtown buildings simply have not been tested or remediated for hazardous material properly, or at all – in public and/or private areas.<sup>41</sup> Congressman Jerrold Nadler's District Office receives calls nearly every day from constituents reporting this fact, and it has been well documented in the press.<sup>42</sup>

Repeated assurances of air quality "safety" have resulted in vast numbers of private spaces in homes and offices being cleaned as if the dust did not contain hazardous materials, despite the fact that official documents note the law requires a contrary presumption. Hearing such assurances stopped many residents and employers from looking for special cleaning or remediation procedures. They simply went about doing a "normal" house or office cleaning for their private spaces.<sup>43</sup> Such spaces cannot be considered properly remediated or safe.

However, even where tenants and building owners understood that this situation wasn't "business as usual," there were still many problems.

With respect to indoor common spaces, building owners have no doubt found it quite easy to skirt the NYC DEP's scant enforcement measures – either by remediating improperly or not taking any action with respect to testing or remediation.<sup>44</sup> Even as tenants in these buildings have found extremely high levels of hazardous materials in common spaces through their private hiring of professional contractors, their numerous calls to the NYC DEP "helpline" to report building owners' inaction has produced little, if any, governmental response.<sup>45</sup> In fact, most tenants have repeatedly expressed extreme frustration when describing their attempts to access help from DEP.<sup>46</sup>

<sup>46</sup> "Official Transcript," EPA National Ombudsman First Investigative Hearing on World Trade Center Hazardous Waste Contamination," February 23, 2002. See specifically testimony from downtown residents and business owners.

A particularly problematic issue is the fact that there is an inherent conflict of interest for building owners to actually do testing, which is expensive, because it might result in them having to hire a professional hazardous materials contractor to do proper remediation, which is even more expensive. Tenants have been forced to go on rent strikes to compel their building owner to test and remediate,<sup>47</sup> and at least one building (80 John Street) has already gone to court.<sup>48</sup>

In a related problem, building owners may use testing methods that are either arguably incapable of finding the type of hazardous materials emitted from the World Trade Center (see above-mentioned reference to problematic DEP-recommended testing approaches), or, if one takes a more cynical view, specifically designed to find nothing dangerous that would require expensive remediation. For example, in the case of Tribeca Tower (105 Duane Street), building management argued that by doing “200 ambient air tests” it had acted “extremely responsive[ly], despite the fact that tenants (supported by private contractors and an EPA scientist) have argued that hazardous materials in settled dust won’t show up in air tests, and that only sensitive dust sampling or aggressive air sampling would yield useful information.”<sup>49</sup>

With no guidance other than the lenient DOH guidelines, individual tenants were left to their own uninformed devices when deciding how to deal with the WTC dust in their apartments.<sup>50</sup> One resident described the chaos that reigned:

We reluctantly made our own rules, divined from press reports, high school science as we remembered it and the advice of friends and neighbors. But even that was mixed. One scientist friend had his apartment tested and declared it safe for his family; the managing agent of his building, however, reported high levels of asbestos and lead. In the end, 248 stuffed animals, 8 handmade baby quilts, 5 mattresses, a trousseau’s worth of sheets and towels, a kitchenful of food and 13 leaf-and-lawn bags of toys went into our trash, but not our books, draperies and upholstered furniture or our clothes, though the bill to dry clean them industrially was \$16,500 . . . . We washed the walls, but didn’t repaint. Some people we know repainted, but kept their mattresses. Some people kept their stuffed animals but threw away their furniture. Some people kept what they couldn’t bear to lose and got rid of the rest. We have still not decided what to do about our floors: will stripping, sanding and resealing them contain the toxic mix of asbestos, fiberglass, concrete,

human remains, heavy metals and the vague “particulates,” or just release more of it into our indoor air?<sup>51</sup>

Indeed, as the responsibility for indoor private spaces has been left to individual residential and commercial tenants, so too have been the associated costs. It has been estimated that a professional remediation for hazardous materials in an average apartment in Lower Manhattan would cost \$10,000 to \$20,000, and that does not include the cost of testing.<sup>52</sup> Covering the cost of testing and remediation in indoor private spaces would necessarily come from one of three sources: the tenant’s own pocket, private insurance (if available), or a government or relief agency.

An expense of \$10,000 to \$20,000 is terribly burdensome, if not prohibitive, for individual tenants (and particularly residents) if it must come out of their own pockets. Therefore, where no other funds were available for proper testing or remediation, tenants either did not remediate or did not remediate properly.<sup>53</sup> In some cases, residents who had nowhere else to turn financially, accepted help from volunteer college students and members of the Southern Baptist Convention.<sup>54</sup> These untrained volunteers came into downtown apartments and cleaned, using methods as or less safe than the dangerous NYC DOH guidelines, and did so without proper protective gear.<sup>55</sup> To the extent that untrained tenants or relief workers have cleaned indoor spaces based on the NYC DOH guidelines or no guidelines at all, those spaces cannot be considered adequately remediated or safe.

According to tenants who do possess private insurance, insurance carriers have haphazardly settled claims with widely varying amounts paid.<sup>56</sup> In many cases, the amounts have been woefully inadequate.<sup>57</sup> Claims have been denied for a variety of reasons. One reason, described by a tenant in the *Washington Post*, describes a

<sup>57</sup> Statement taken from Constituent Services Staff Members, Office of Congressman Jerrold Nadler (NY-08) and “Official Transcript,” EPA National Ombudsman First Investigative Hearing on World Trade Center Hazardous Waste Contamination,” February 23, 2002. See specifically testimony from downtown residents and business owners.

horrendous, vicious circle. Mr. George Tabb, a Tribeca resident, reported that his “. . . insurance company won’t pay to clean his apartment of dust and asbestos until his landlord cleans up the building’s ventilation system. Management started a cleanup last month, but not an asbestos abatement.”<sup>58</sup>

Even more disturbing is the fact that some insurance companies have denied claims (for rental assistance, air purifiers, and hazardous materials testing and remediation) to both tenants and building owners on the sole basis of EPA’s safety assurances.<sup>59</sup> Individual tenants have also reported that relief agencies, including the Red Cross, and the Federal Emergency Management Agency (FEMA) have also denied assistance for rental assistance and proper testing and remediation of common and private spaces on the basis of Ms. Whitman’s statement.<sup>60</sup>

FEMA, in its “case-by-case” approach, has provided some assistance to individual residents for “cleaning,” though many individuals have reported having their application denied or have received very few funds.<sup>61</sup> Moreover, FEMA announced in one of its own bulletins, that residents could be eligible for such funds, but only if the individual is willing to forgo rental assistance:

If you were affected by the World Trade Center attack and receive rental assistance from the Federal Emergency Management Agency (FEMA), you may use the funds to clean your residence. ‘We’re giving people the option to decide what makes most sense for them – either cleaning their dwellings or finding someplace else to live,’ said Michael Cosbar, FEMA housing officer. Instead of using the check to rent another place, renters can use the funds to clean their residences. However, if you use the funds for cleaning, you will be ineligible for more FEMA rental assistance because you will be able to move back into your home.<sup>62</sup>

Each of the problems noted above (and there are undoubtedly plenty of others) has contributed to the fact that there has been utterly uneven, if not totally inadequate, testing and remediation of hazardous materials in buildings in Lower Manhattan. This fact, in and of itself, presents the most troubling issue: even when public spaces or single apartments or offices are remediated appropriately, ventilation systems can move

<sup>62</sup> FEMA, “Disaster Assistance Guide: United We Stand,” New York, November 2, 2001, FEMA Issue 2.

hazardous materials from unremediated spaces to those already remediated.<sup>63</sup> As one downtown resident put it, "Indoor air quality is a touchy issue in our building. Converted in the late 1970's, we have a primitive central air system that circulates air from apartment to apartment. Some people in our building hired professional cleaners. Others did it themselves."<sup>64</sup> Therefore, tenants who may believe they are living in a "safe" environment because they have paid considerably for proper remediation, may well be living in recontaminated areas.

It goes without saying that hazardous materials emitted from the World Trade Center that remain inside buildings in Lower Manhattan pose a potentially serious public health threat to residents, workers and visitors. This threat has been detailed in various government hearings and numerous press accounts by a wide array of pre-eminent public health experts.

### **The EPA's Actions Violate Federal Law**

By allowing indoor air quality in residential and commercial buildings to be handled by the City of New York, and by not properly exercising its oversight authority, the EPA violated federal law. The EPA has the clear authority to respond to the release of hazardous substances that may present an imminent and substantial danger to public health.<sup>65</sup> The National Contingency Plan (NCP), which is administered by the EPA and authorized by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), is the federal plan for responding to such a release.<sup>66</sup> The NCP lays out specific procedures and guidelines, including the designation of an On-Scene Coordinator (OSC) who is responsible for directing response efforts and coordinating all other efforts at the scene of a discharge or release.<sup>67</sup> The federal regulations make clear that the EPA has the authority to respond to the release of hazardous substances pursuant to the NCP.

When asked why the City has taken the lead on indoor air, and how that decision was made, the EPA has stated that mission assignments were made by FEMA.<sup>68</sup> The

<sup>65</sup> 42 USC 9604. The President is authorized to act: 1) Whenever (A) any hazardous substance is released or there is a substantial threat of such a release into the environment, or (B) there is a release or substantial threat of release into the environment of any pollutant or contaminant which may present an imminent and substantial danger to the public health or welfare, the President is authorized to act, consistent with the national contingency plan, to remove or arrange for the removal of, and provide for remedial action relating to such hazardous substance, pollutant, or contaminant at any time...or take any other response measure consistent with the national contingency plan which the President deems necessary to protect the public health or welfare or the environment. This authority is also cited in 40 CFR 300.130 (c). This authority is delegated to the EPA Administrator pursuant to Executive Order 12580, later amended by Executive Order 12777.

<sup>66</sup> CERCLA is codified in Chapter 103 of Title 42 USC. The NCP is authorized in 42 USC 9604; 40 CFR 300.

<sup>67</sup> 40 CFR 300.135 (a)

<sup>68</sup> Whitman, Christine Todd, Letter to Congressman Jerrold Nadler, transmitted via fax February 22, 2002.

EPA claims that it is operating at the World Trade Center site under the Federal Response Plan (FRP), the FEMA plan which establishes a process for coordinating federal assistance pursuant to the Stafford Act.<sup>69</sup> EPA claims that, under the FRP, local governments have primary responsibility for responding to an event.<sup>70</sup>

However, EPA's statement that it is merely following FEMA and the Federal Response Plan, and its characterization of this plan, is misleading for a number of reasons. First, the Stafford Act does not supercede the EPA statutes.<sup>71</sup> All activities under FEMA must comply with national environmental policies.<sup>72</sup> The Federal Response Plan also clearly states that other federal emergency response plans cannot be disregarded, but rather implemented concurrently when there is an incident involving hazardous substances.<sup>73</sup> The FRP specifically lists the NCP as one such emergency response plan.<sup>74</sup> Second, and most importantly, the FRP actually triggers the National Contingency Plan.<sup>75</sup> According to the Code of Federal Regulations, "the NCP applies to and is in effect when the Federal Response Plan and some or all its Emergency Support Functions (ESFs) are activated."<sup>76</sup> Therefore, if the EPA is not acting pursuant to the National Contingency Plan, it is in clear violation of the law.

Third, even if, for the sake of argument, the Federal Response Plan is the only plan in effect (which is clearly not the case), federal assistance is coordinated along thirteen Emergency Support Functions. The EPA is the primary agency responsible for coordinating Emergency Support Function #10: Hazardous Materials.<sup>77</sup> As the primary agency, the EPA has "operational responsibility" for orchestrating federal agency support and managing mission assignments in this area.<sup>78</sup> The EPA has no legal basis to shirk its responsibility in this regard.

The EPA might also say, as it has in the past, that it does not have the proper legal authority to test and remediate all areas affected by the collapse of the World Trade Center because the Clean Air Act does not govern indoor air. This is, again, utterly misleading. Section 303 of the Clean Air Act gives the EPA authority to protect human health when there is an "imminent and substantial endangerment" presented by a source of pollution.<sup>79</sup> The intent of Congress is clear in this regard. A 1970 Senate Report on Section 303 states, "The levels of concentration of air pollution agents or combination of agents which substantially endanger health are levels which should never be reached in any community. When the prediction can reasonably be made that such elevated levels could be reached even for a short period of time – that is that they are imminent – an

<sup>78</sup> Ibid., p. 28.

<sup>79</sup> 42 USC 7603

emergency action plan should be implemented.”<sup>80</sup> In short, the EPA should not wait for people to get sick before it acts, and it clearly has the authority to act under this law. An EPA memo entitled “Guidance on the Use of Section 303 of the Clean Air Act” was issued to the Regional offices on September 15, 1983, outlining these very points.<sup>81</sup>

Although the Clean Air Act is primarily intended to address source pollution, Section 303 illustrates that EPA has authority under several statutes to respond to the release of hazardous materials that pose a threat to human health. Also, the Clean Air Act is not the only governing statute. The EPA has the authority to act on indoor air under the National Contingency Plan, and this authority is not drawn into question by the Clean Air Act.

As administrator of the NCP, the EPA has the responsibility through OSCs to direct response efforts and coordinate all other efforts at the scene of a release.<sup>82</sup> These response efforts include indoor air and environments. The NCP mandates that the OSC, among other things, collect pertinent facts about the release, the nature, amount and location of released materials, the pathways to human exposure, and the potential impact on human health and the environment.<sup>83</sup> There is no delineation between indoor and outdoor air, particularly where there is a threat to public health. In fact, under the NCP, the EPA is authorized to “enter any vessel, facility, establishment or other place, property, or location...and conduct, complete, operate, and maintain any response actions authorized by CERCLA or these regulations.”<sup>84</sup> In other words, a response under the NCP is not limited to outdoor air, and the EPA has specific authority to remediate indoor environments.

Although the EPA has discretion to delegate response efforts to other agencies, all such decisions must be made through the organizational structure of the NCP, for which the EPA has oversight.<sup>85</sup> Therefore, any actions taken by any agency in response to the release of hazardous substances produced by the collapse of the World Trade Center fall under EPA oversight. If the City takes the lead on indoor air, the EPA is not relieved of its responsibility in this regard.

As mentioned previously, the EPA, on its website and in public press releases, has referred people to the New York City Department of Health (NYC DOH) recommendations for guidance on reoccupying their homes and businesses.<sup>86</sup> These

recommendations advise people to remove dust using a “wet rag or wet mop.”<sup>87</sup> This advice is clearly illegal for a number of reasons. First, as noted above, OSHA Assistant Secretary Henshaw issued a letter stating that the settled dust from the collapse of the Twin Towers “must be presumed to contain asbestos” and therefore, OSHA federal regulations apply to the remediation of this material.<sup>88</sup> Asbestos-containing material is a hazardous substance, and falls under the requirements of the NCP.<sup>89</sup> Therefore, EPA must exercise oversight of all the settled dust from the collapse of the World Trade Center, including dust that settled inside people’s homes and businesses.

Second, the NYC DOH recommendations are for people reoccupying commercial offices, as well as homes, yet the recommendations omit any mention of applicable OSHA regulations, or that all of the dust must be presumed to contain asbestos.<sup>90</sup> All of this is under EPA oversight.<sup>91</sup> Yet, not only does the EPA allow these recommendations to be made by NYC DOH, the EPA actually refers people to them. As a result, the people of Lower Manhattan are being advised to clean asbestos-laden dust with wet rags and mops, with no enforcement of OSHA regulations or EPA regulations requiring the use of properly trained personnel to abate hazardous materials. This is clearly not the intent of federal law, for if average citizens could remediate hazardous substances, pollutants or contaminants with a wet rag, there would be no need for a National Contingency Plan in the first place.

The EPA has the ability to correct these wrongs and act in accordance with the law. Even if a decision had been made for the City to take responsibility for indoor air, federal statutes provide for the EPA to act when nonfederal authorities are either unwilling or unable to do so, and to do so in a timely manner.<sup>92</sup> The EPA is aware of the inadequate measures taken by the City. It was the EPA that faxed us the initial September, 2001 DEP notice to building owners, which contained no enforcement measures or resources for remediating homes and businesses. The EPA received independent test results in October, 2001 that showed elevated levels of hazardous materials inside people’s apartments. The EPA heard testimony from residents at the Senate field hearing in New York. The press accounts from the last two months alone should make the agency aware that hazardous materials are still contaminating peoples’ homes. The EPA cannot plead ignorance, nor can it point fingers at FEMA. To do so is to misrepresent the law.

As stated before, the EPA should be operating in New York City in accordance with the National Contingency Plan. The NCP exists so that there is a transparent, accountable and coordinated decision-making process. If decisions were made in Lower Manhattan pursuant to the NCP, the EPA has provided no evidence of the process. Because the Federal Response Plan activated the NCP, the EPA has the responsibility to manage hazardous materials remediation. The NCP is authorized by CERCLA, despite the fact that Lower Manhattan is not a Superfund site, nor does the EPA need to use Superfund Trust Fund money in exercising its authority under the law.<sup>93</sup> The NCP gives the EPA the authority and the resources to ensure that hazardous substances, pollutants and contaminants do not pose a threat to public health. The EPA has failed to uphold this law in response to the collapse of the World Trade Center. It must remedy this situation by complying with the NCP now.

### **Why Is the EPA Treating New Yorkers and New York City Differently?**

The EPA's inaction in New York City downtown residences and commercial buildings stands in stark contrast to its response in its own building at 290 Broadway and to other non-Superfund hazardous materials contamination sites around the country.

The issue of the EPA's double standard, with respect to its own building at 290 Broadway, was first raised by Dr. Cate Jenkins, in a memo in which she described a conference call in which EPA Region II Counsel Walter Mugdan stated that the building had been "professionally cleaned." Jenkins thus charged that the EPA had better protected its own employees than it had the residents of Lower Manhattan, who had been referred to the lenient DOH guidelines which recommended cleaning with wet rags and mops.<sup>94</sup>

Upon learning this, Congressman Jerrold Nadler, the New York Environmental Law and Justice Project, and the EPA National Ombudsman each separately requested documents from the EPA related to the alleged cleanup. Congressman Nadler's request was answered in a letter from EPA Administrator Christine Todd Whitman on February 22, 2002. In that letter, she dismissed the double standard charge:

EPA did not set a more stringent standard of cleanup for these federal buildings, and the lobby cleanup was consistent with the New York City Department of Health advisory. After noting significant amounts of dust tracked into 290 Broadway and 26 Federal Plaza by workers responding. . . , the General Services Administration asked EPA to clean the lobbies. The work was done by EPA contractors using HEPA vacuums already operating in the same area. As outlined in the enclosure, EPA collected seven air samples at 26 Federal Plaza and six air samples at 290

---

<sup>93</sup> 40 CFR 300

<sup>94</sup> Haughney, Christine, "House Member Questions EPA Office Cleanup," *Washington Post*, January 18, 2002.

Broadway, and found results below levels of concern [emphasis added]..<sup>95</sup>  
(Note that there is no mention of dust sampling.)

The enclosure to which Ms. Whitman refers is entitled "USEPA Air Analytical Results from 9/13/01 Sampling Event." Under the section "methodology," the document indicates that both air and dust samples were taken. Air samples were "analyzed by TEM EPA 40CFR763 AHERA" and dust samples were "analyzed by PLM EPA-600 R-93/116."<sup>96</sup> Ms. Whitman's letter implies that, because the tests found only results below the "level of concern," there was no special action taken in the buildings.

But in reviewing the documents obtained under FOIA by the New York Environmental Law and Justice Project (documents that Ms. Whitman did not include in her correspondence to Congressman Nadler), Dr. Jenkins found that positive results for hazardous materials were indeed detected by EPA tests. In fact, the documents show that the EPA used a much more sensitive "TEM" method for settled dust sampling which found a "positive" result for hazardous materials, despite Ms. Whitman's enclosures in the Nadler letter that said it had used the "PLM" method. According to Ms. Jenkins, this high sensitivity transmission electron microcopy or TEM method for dust sampling was used nowhere else in Lower Manhattan, and "but for the results from the more sensitive tests, Region 2 would not have abated asbestos from its building." That "abatement," according to Jenkins, included, but was not limited to, HEPA vacuuming and an evacuation for some period of time.<sup>97</sup> This is, indeed, in stark contrast to the DOH cleanup guidelines that EPA officials directed Lower Manhattan residents to follow: i.e., use of a wet rag or mop.

Either the testing and cleanup measures used at the EPA office were necessary to protect its workers or, the EPA wasted tax-payer dollars on an unnecessary cleanup. If such sensitive testing is used in EPA's own building, why not in the rest of downtown Manhattan?

The EPA is also treating New York City differently than it has treated many non-Superfund hazardous materials contamination sites around the country. Whereas the EPA has stated it lacks jurisdiction to test for and remediate hazardous materials in private spaces in Lower Manhattan, it has acted on indoor air in locales (with no Superfund designation) such as Herculaneum, Missouri; Kellog, Idaho; and MacFarland, California.<sup>98</sup>
